

TOPIC 2.1

CREATING A WEB PAGE USING HTML

OBJECTIVES

- Using HTML 5 to structure web documents
 - Introduction to usage of HTML 5
 - Document structure

HTML AND STYLE SHEETS

- **HTML** marks the **different parts of a document**, but it does not indicate how document content should be displayed by browsers
- For this reason, the exact **appearance of each page element** is described in a separate document known as a **style sheet**

HYPERTEXT MARKUP LANGUAGE (HTML)

- **Describes** the **content** and **structure** of information on a web page
 - not the same as the *presentation* (appearance on screen)
- It is not a programming language, it is a **markup** language
- A **markup** language is a set of **markup** tags :
 - example : `<title>...</title>` `<nav>...</nav>` `<p>...</p>`
- Text contents are surrounded with opening and closing tags
 - example: `<p>`This is a paragraph`</p>`

HISTORY OF HTML

- 1990
 - Tim Berners proposed an Internet based hypertext Systems
- 1991-2000
 - Hypertext Markup Language (HTML) draft published
 - HTML 2.0, 3.2, 4.0, 4.0.1
- 2001-2011
 - XHTML 1.1, 2.0
 - HTML 5 Draft
- Oct 2014
 - HTML 5 Finalised

HTML 5

- HTML 5 is a cooperation between the W3C and WHATWG(Web Hypertext Application Technology Working Group)
- Some rules for HTML5 were established:
 - New features should be based on HTML, CSS, DOM, and JavaScript
 - Reduce the need for external plugins (like Flash)
 - Better error handling
 - More markup to replace scripting
 - HTML5 should be device independent
 - The development process should be visible to the public

BROWSER SUPPORT FOR HTML 5

- HTML5 has been finalised (official standard) in Oct 2014
- Currently, no one browser have full HTML5 support
- But all major browsers (Safari, Chrome, Firefox, Opera, Internet Explorer) continue to add new HTML5 features to their latest versions.
- Go to <http://html5test.com> to test how well your browser support HTML 5
- In this module, we will be using Google Chrome

BASIC HTML STRUCTURE

```
<!DOCTYPE html>
<html>
  <head>
    <title>A Simple Example</title>
  </head>
  <body>
    <p>IT1209 Web Applications Development.</p>
  </body>
</html>
```

XHTML

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"  
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
```

```
<html>
```

```
  <head>
```

```
    <title>A Simple Example</title>
```

```
  </head>
```

```
  <body>
```

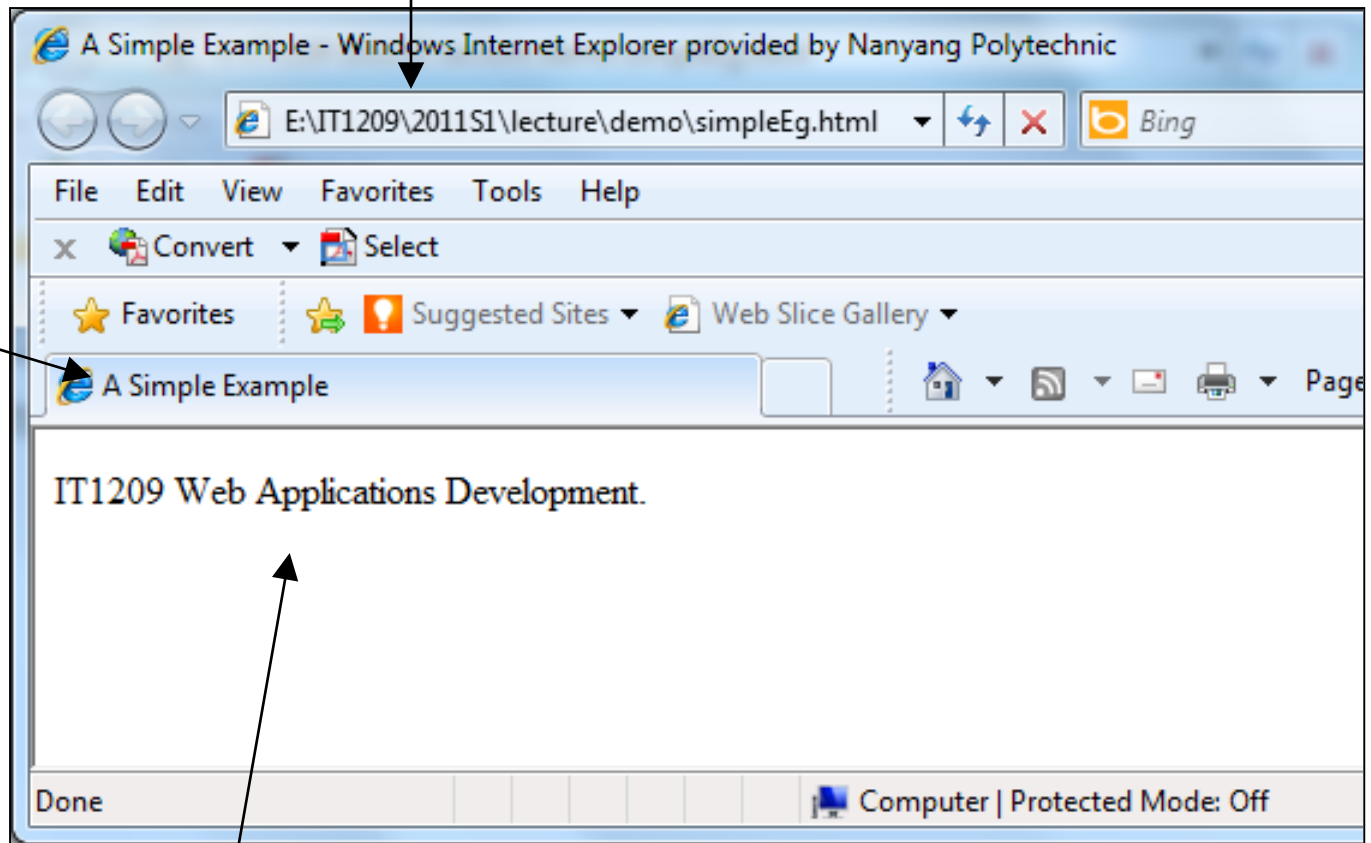

```
    <p>IT1209 Web Applications Development.</p>
```

```
  </body>
```

```
</html>
```

URL

Title

The content of the **Body**
is displayed in the
browser

BASIC HTML STRUCTURE

- The **doctype** declaration specifies that the document is written in HTML
- An HTML document is divided into two main sections: the **head** and the **body**
- **Head:**
 - **Describes** the page
 - Contains **information about the document**, for example the document title or the keywords
 - The content of the head element is **not displayed** within the Web page
- **Body:**
 - Contains all of the **content to appear** on the Web page
 - Contains code that tells the browser how to render the content

BASIC HTML STRUCTURE

- A HTML document is saved into a file ending with extension **.html or .htm**
- HTML 5 is **case-insensitive**
 <html>.....</html>
 <HTML>.....</HTML>
 - the most common convention is to stick with **lowercase**

HTML ELEMENTS

- An HTML document is composed of **elements** that represent distinct items in the Web page, such as a paragraph, the page heading, or even the entire body of the page itself
- Elements are marked by one or more **tags**
- A **two-sided tag** is a tag that contains some document content. General syntax for a two-sided tag:

<element>content</element>

TYPES OF ELEMENTS

- **Inline element**

- Such as individual words or phrases within a paragraph.
- It will not start from a new line.
- e.g. `...` (enclose a phrase)
`<a>....` (indicate a link)

TYPES OF ELEMENTS

- **Block element**

- It appears as an individual block.

- It will start from a new line.

- e.g. `<div>...</div>` (indicate a section)
 `<h1>...</h1>` (indicate a heading)
 `<p>...</p>` (indicate a paragraph)

TYPES OF ELEMENTS

- **Empty element**

- it contains **no value/content**

- It may contain attributes

- e.g. `
` (indicate a line break)
`<wbr/>` (to indicate word Break Opportunity)
`<hr/>` (to separate content or a shift of topic)

PAGE TITLE: <TITLE>

- describes the title of the web page
- `<title>`This is my blog.`</title>`
- placed within the head of the page
- displayed in the web browser's title bar and when bookmarking the page

PARAGRAPH: <P>

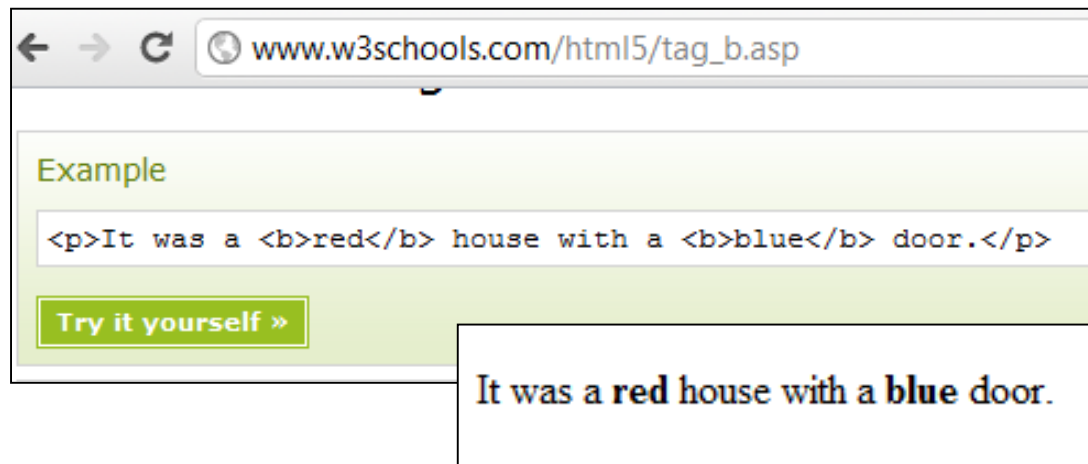

- paragraphs of text (block)
- placed within the body of the page
- `<p>`This is my first html page.`</p>`
- [more paragraph examples](#)

HEADINGS: <H1>, <H2>, ..., <H6>

- headings to separate major areas of the page (block)
- <h3>My Educational Background</h3>
- [more heading examples](#)

BOLD TEXT:

- The `` tag specifies bold text

- To be used as last resort

ITALICIZE TEXT: <i>

- The <i> tag gives text more emphasis

Example

```
<p>He named his car <i>The lightning</i>, because it was very fast.</p>
```

Try it yourself »

He named his car *The lightning*, because it was very fast.

SPAN :

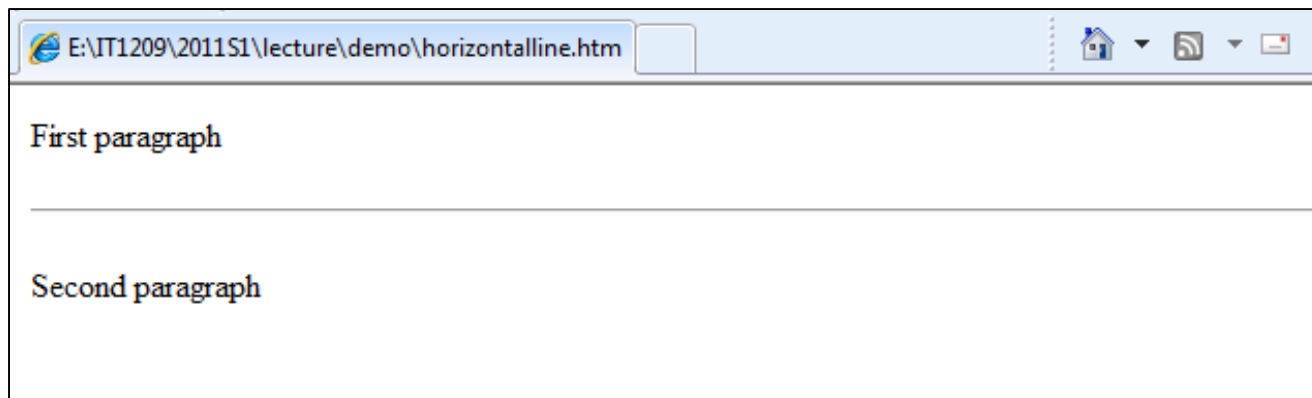

- Used for grouping a section of text content(phrase)
- Commonly used solely to apply styles

```
<body>
<p>The house is on <span style="color:red">fire</span>!</p>
</body>
```

HORIZONTAL RULE: <HR>

- a horizontal line to visually separate sections of a page (block)
- `<p>First paragraph</p><hr><p>Second paragraph</p>`

LINE BREAK:

- inserts a single line break
- <p>This sentence contains
 a line break.</p>

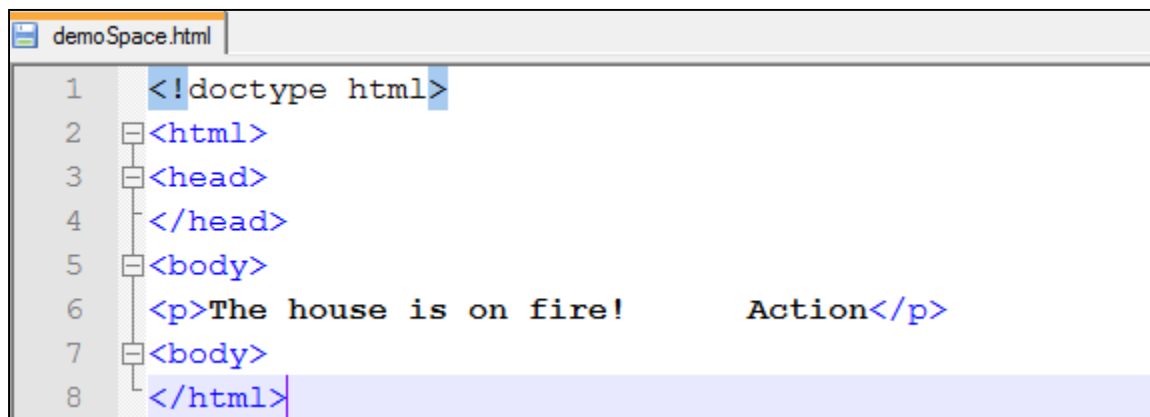

WORD BREAK OPPORTUNITY :

<WBR>

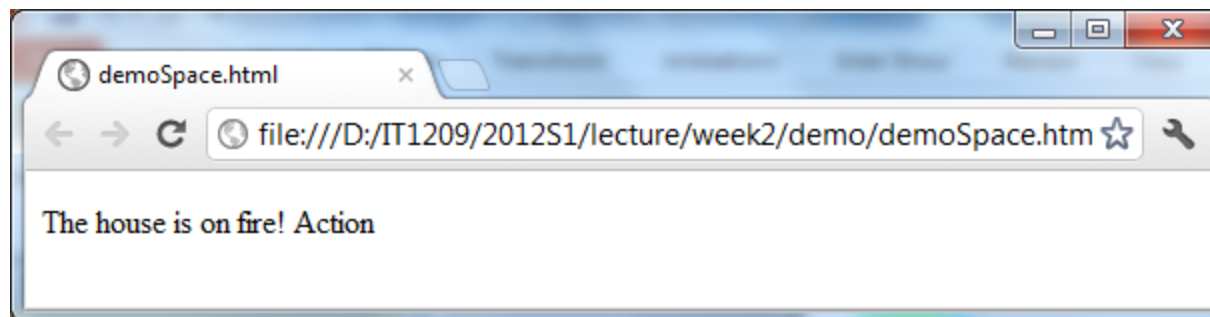

- Specifies where a browser may add a line break if needed
- May use it for long words that might present problems if they appear near end of a line and cause awkward spacing

INSERT A SPACE

- Browsers will ignore any extra space in your HTML code

```
1 <!doctype html>
2 <html>
3 <head>
4 </head>
5 <body>
6 <p>The house is on fire! Action</p>
7 <body>
8 </html>
```

SPECIAL CHARACTERS

- Some characters are reserved in HTML
- Not possible to use the less than (<) or greater than (>) signs in your text, because the browser will mix them with tags
- To display reserved characters, use character entities in the HTML source code
- Format of character entity:
`&entity_name;` or `&#entity_number;`

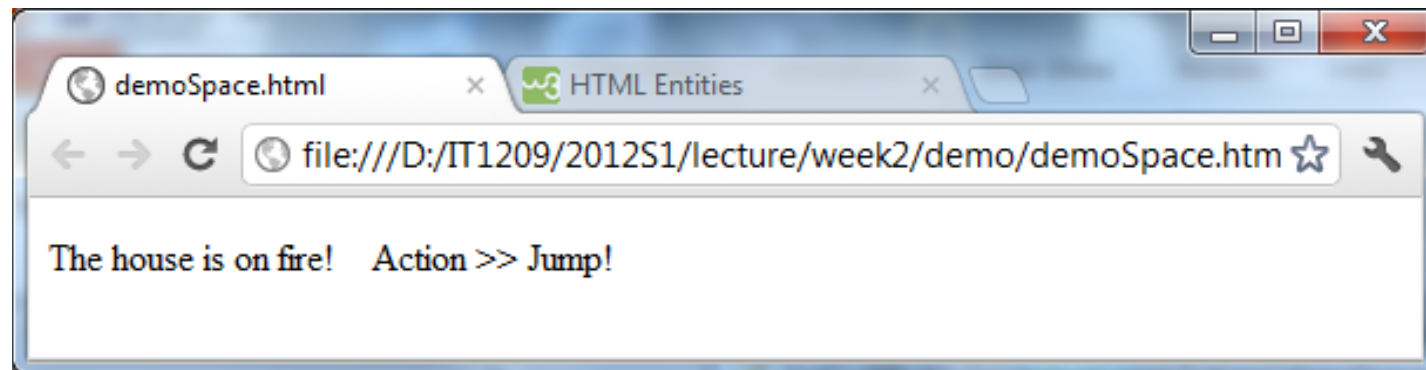

SPECIAL CHARACTERS

Example of Special Characters

Character	Description	Entity Name	Entity No.
	non-breaking space	 	
<	less than	<	<
>	greater than	>	>
&	Ampersand	&	&
"	quotation mark	"	"
'	apostrophe	'	'
©	copyright	©	©
¢	cent	¢	¢

SPECIAL CHARACTERS

```
<body>
<p>The house is on fire!    Action    >> Jump!</p>
</body>
```

INSERT A COMMENT: <!-- -- >

- Comment tag is used to insert comments in the source code.
- Comments do not appear when browser displays the web page

```
<body>  
<!-- This is my first web page -->  
<p>The house is on fire!</p>  
</body>
```

ADDING ATTRIBUTES TO AN ELEMENT

Attribute provides more details information pertaining to the element it belongs to.

- Example: (attribute name be lower case, value must be quoted)

- `<p id="first">This is a paragraph </p>`

Attribute name

Attribute value

- Example: (attribute must have value)

❏ `<option selected="selected">`

.....

`</option>`

ADDING ATTRIBUTES TO AN ELEMENT

``

- Attributes are used to **set various properties** of an element

TWO IMPORTANT GLOBAL ATTRIBUTES

- **id**

- Every element in a web page can be assigned a **unique id value** which uniquely identify itself in the web page. The analogy for this is your admin no in NYP.

- For example:

```
<h1 id="mainHeading">Cyber bullying Crackdown</h1>
```

- **class**

- Every element in a web page may belong to one or more classes. Elements with the **same class value** belongs to the same class. Class is especially useful in styling. More will be covered in later part of the module.

- For example:

```
<h1 id="mainHeading" class="center">Cyber bullying Crackdown</h1>
```

```
<h2 id="newsH2" class="center_underline">Recent Tragedies</h2>
```
